

## Software Deployment Patch Management OS Deployment

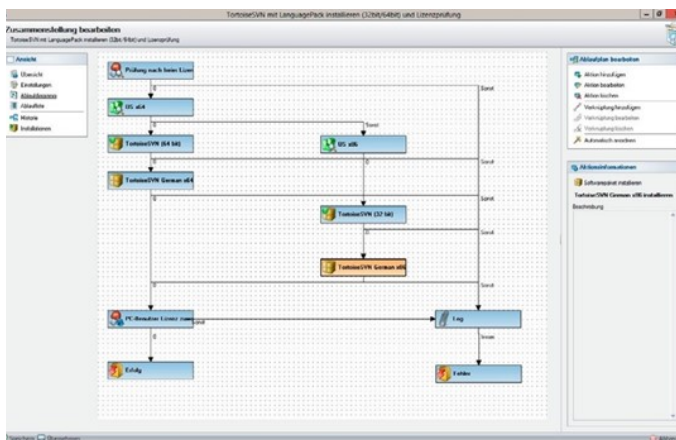

### The Challenges

Upgrading to a new operating systems, upgrading a new version of software, deploy new software, the challenges can be enormous.

Distributed environments, organisational structures, differing systems all add to the challenges involved in rolling out new software.

DeskCenter's unique architecture, coupled with fully featured software packaging, deployment and update capability reduce the effort required, ensuring timely and efficient updates across your enterprise.

Fully integrated within the DeskCenter Suite, Software Management is no longer a difficult, time consuming activity.

Our unique software deployment designer allows quick and easy creation of software compilations, providing full integration with License Management, Service Desk other DeskCenter modules and third party applications.

### Software Deployment

Centrally controlled, automated Software Deployment with DeskCenter Management Suite provides a flexible solution to supply complete software packages across the entire organization. It provides trouble-free deployment of:

- Microsoft Installer (MSI) packages
- ThinApp packages (VMWare)
- Standard setups and drivers
- Batch files and scripts

The fully automated installation, configuration and support provides for the low maintenance and operation of clients. Along with the important key features, it manages a large number of additional requirements, not only can you install software, but complex software packages can be uninstalled and damaged installations can be repaired.

### OS Deployment

DeskCenter' OS Deployment saves time in the IT department and frees up resources. Fully integrated into the Suite's existing Client and Server Management, OS deployment can deliver significant time savings when upgrading or deploying new systems. In combination with Software Deployment you can equip your client computers or servers with all the software needed, from the operating system up to the different software applications required.

### Patch Management

Patch Management is one of the most important tasks of system administrators and IT managers. Software updates and patches must be provided timely and managed consistently. With DeskCenter Patch Management you can manage, provide and control patches and software updates. Dangerous security flaws are avoided and the IT environment remains stable and effective.

# Automated Setup and Centralised Software Deployment

## Key Features

- Distributed, redundant software deployers.
- Windows share , FTP ( S ) , HTTP ( S ) , WebDAV (SSL).
- Bandwidth management
- Installation of standard setups, MSI packages and service packs
- Integration of the virtualization platform ThinInstall (ThinApp)
- Deliver, update and uninstall software packages using software rules
- Combine installations into software packages
- Integration of script actions before and after the setup
- Cache for software installations

## Software Rules

Using rules, software can be installed, uninstalled or updated to the current state. With new requirements or systems, predefined rules are activated automatically to install related software. This guarantees the same status of installations in the IT infrastructure. Software rules can be applied to computers or their users.

## Approved Software Lists

Publish software packages to your service desk, allowing end users to request software installs directly.

Approve, Decline or Alter the request and scheduling the automatic deployment of the software package empowers your users while maintaining control of the assets deployed on your networks.

## Comprehensive Job Control

Installations can be done immediately or scheduled. At the client, the jobs can run in the background or the user can interact with the process.

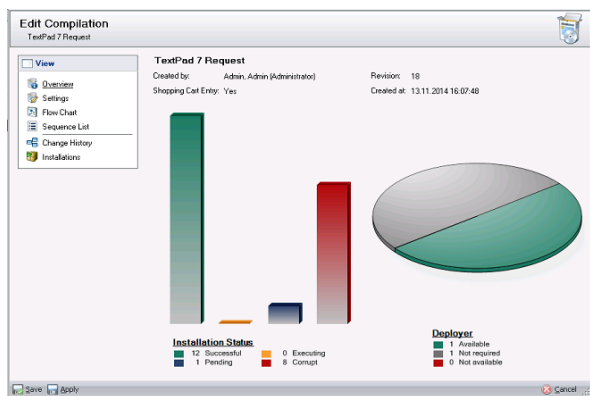

Bandwidth management, local cache's, redundant software deployers can all be used to optimise the deployment of large software packages across slow or distributed networks.

## Opportunities

Using a combination of Software Asset Management, Application Metering, Software Deployment and Software Rules opens up opportunities to optimise your software estate.

Identify where applications are no longer used, automatically uninstalling and reclaiming the associated software licenses can save significant on ongoing software costs.

All delivered through one, fully integrated system.
